

Managed Firewall Service

Managed Services Solution Components

We realise that clients have different needs based on their future roadmap and current investments. Our suit of products is designed to assist them at the point of their needs. To this end, we have built a modular service made up of; Implementation Services, Managed Firewall, Manager as a Services, Analyzer as a Service, and Move, Adds and Changes. Our team of expert engineers will also assist with putting together a services architecture that is aligned to the business objectives our client requires.

Full Managed Services

The full managed service is designed for clients who either, cannot, or do not want to invest in firewall resources. This is a remote managed offering that caters for the full services continuum, including hosted manager and analyzer as a service and access to qualified technical resources.

The reality is that cyberthreats don't
take a break when trying
to compromise your network.
We address this by offering 24/7
monitoring to ensure your network
stays safe consistently.

Full Managed Firewall (MCDS)

Remote managed services including hosted manager and analyzer as a service and access to qualified technical resources through the Moves, Additions, Changes and Deletes (MACDs) offering.

- Move, Adds and Changes
- Manager as a Services
- Analyzer as a Service

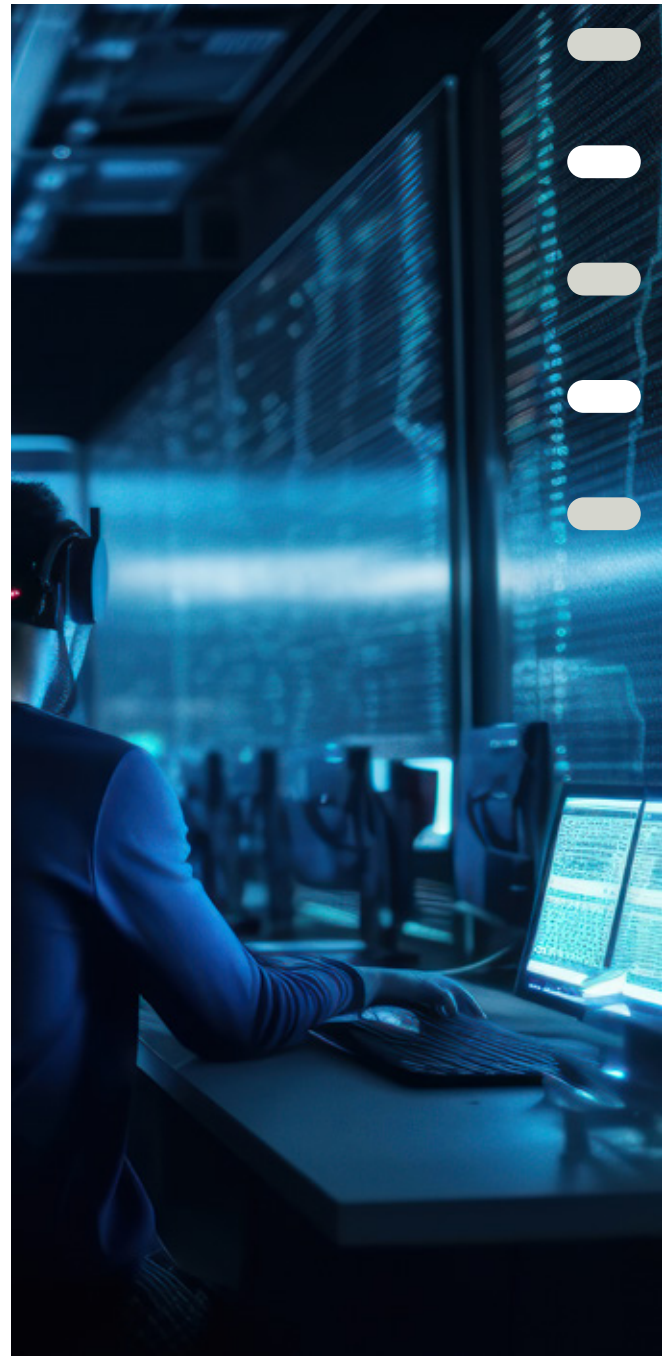

Moves Add's and Changes (MACDs)

Coordination and management of standard preapproved changes to your IT assets. Get access to accelerated processes, improved operational efficiencies, and reduced administration costs.

Benefits

- Reduction in downtime of business services from failed changes.
- Less pressure on internal teams to manage changes.
- Accurate reporting and assessment of service unit balances for effective cost control.

The main benefit of utilising our managed firewall service is the peace of mind that your network is secure, while allowing you to focus on your core business objectives.

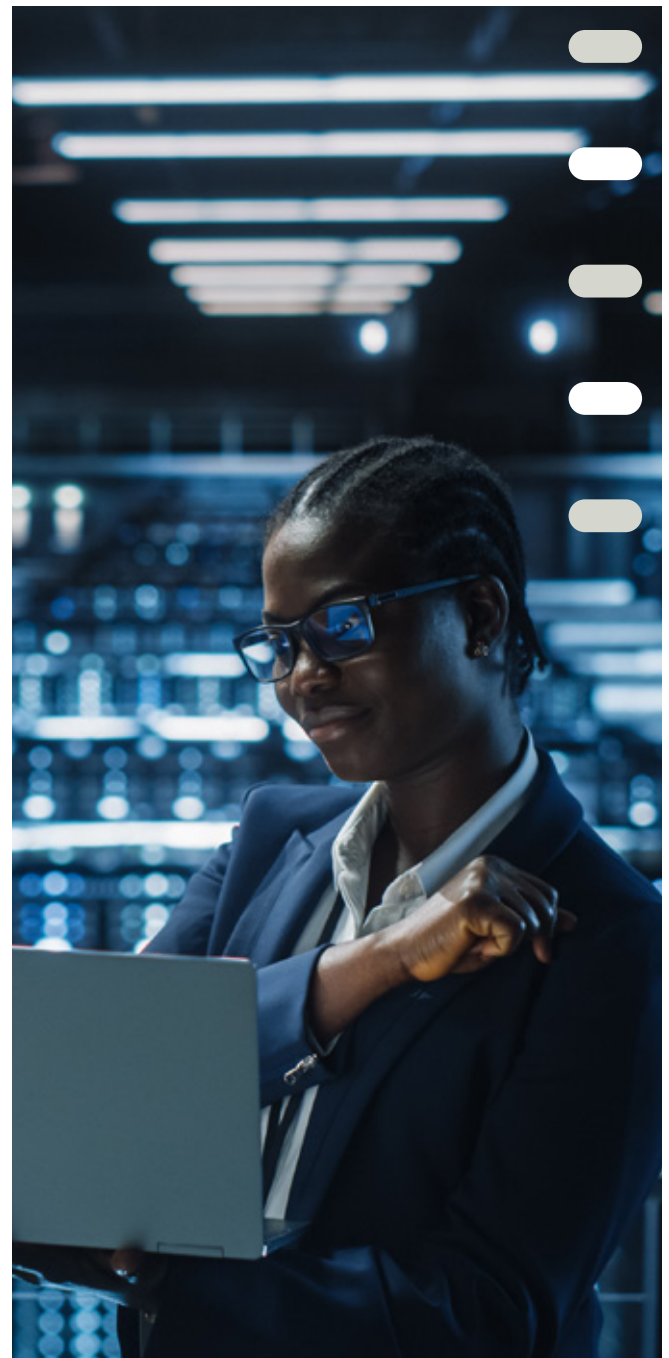

Manager as a Service (MaaS)

Manager provides automation-driven centralised management of your devices from a single console. This process enables full administration and visibility of your network devices through streamlined provisioning and innovative automation tools. Single-Pane Management and Provisioning streamlines centralised policy and object management and provisioning, automatic revision history and control, and enhanced role-based access control (RBAC) features for script management and IPS management with role separation.

Our Manager as a Service offering is hosted locally in South Africa, this is a fully functional Manager. This is ideal but not limited to clients who are looking to invest in their own infrastructure and resources.

Benefits

- Each client has a dedicated Administrator Domain (ADOM) Access for their devices, which is self-managed. While our experienced engineers take care of all licencing, hosting, and patching of the Manager.
- The locally hosted Manager ensures that data and backups do not leave the country to comply with regulations and data policies. This also eliminates the need to compete for international bandwidth and mitigates high latency issues.

Analyzer as a Services (AaaS)

Analyzer is a powerful log management, analytics, and reporting platform that provides organisations with a single console to manage, automate, orchestrate, and respond; enabling simplified security operations, proactive identification and remediation of risks, and complete visibility of the entire attack landscape.

Our locally hosted Analyzer is a shared service offering, which is a fully functional Analyzer with the Indicators of Compromise (IOC) License. This is ideal, but not limited to clients looking to invest in their own infrastructure and resources.

Benefits

- Dedicated ADOM Access for their devices that is self-managed, where they have access to over 600+ Templates and over 1000 Datasets that can be used to create custom reports while we take care of all licencing, hosting, and patching of the Analyzer.
- The locally hosted Analyzer ensures data compliance with regulations and policies and mitigates the need to compete for international bandwidth.

Organisations with complex networks, and those that handle sensitive data or rely on online transactions may find having a managed firewall services partner particularly beneficial, if not essential.
